ESSENTIAL SUBHYPERMODULES AND THEIR PROPERTIES

BEHNAM TALAEE *

Abstract. Let \( R \) be a hyperring (in the sense of [8]) and \( M \) be a hypermodule on \( R \). In this paper we will introduce and study a class of subhypermodules of \( M \). We will study the intersection of this kind of subhypermodules and give some suitable results about them. We will proceed to give some interesting results about the complements, direct sums and independency of this kind of subhypermodules.

1. Introduction

The concepts of hypergroups, hyperrings and hypermodules and some generalizations of them were introduced by some authors, see for examples [1, 3, 4, 5, 6, 7, 8, 11, 12].

A hyperstructure is a nonvoid set \( H \) together with a function \( . : H \times H \rightarrow P^*(H) \), where \( . \) is called a hyperoperation and \( P^*(H) \) is the set of all nonempty subsets of \( H \).

For \( A, B \subseteq H \) and \( x \in H \) we define

\[
A.B = \bigcup_{a \in A, b \in B} a.b, \quad x.B = \{x\}.B, \quad A.x = A\{x\}.
\]

Definition 1.1. A hyperstructure \( H \) with a hyperoperation "\+" is called a canonical hypergroup if the following hold for \( H \);

(i) \((x + y) + z = x + (y + z)\) for all \( x, y, z \in H \);
(ii) \(x + y = y + x\) for all \( x, y \in H \);

*Corresponding author.
(iii) There exists an element 0 such that $0 + x = \{x\}$, where $\{x\}$ is the singleton set with element $x$, for every $x \in H$;
(iv) For each $x \in H$ there exists a unique element $x' \in H$, such that $0 \in x + x'$.
   (we denote $x'$ by $-x$ and it is called the opposite of $x$). Also we write $x - y$ instead of $x + (-y)$;
(v) If $z \in x + y$, then $y \in z - x$ for all $x, y, z$ in $H$.

Note that 0 is unique and for every $x \in H$ we have $x + 0 = 0 + x = \{x\}$.
We identify a singleton set $\{x\}$ by $x$.
A nonempty subset $G$ of a canonical hypergroup $H$ is called a canonical sub-
hypergroup of $H$ if $G$ is a canonical hypergroup.
Canonical hypergroups were studied by J. Mittas in [11].

A non-void set $R$ with a hyperoperation "+" and with a binary operation "." is called a hyperring if

$$(R_1) \ (R, +) \text{ is a canonical hypergroup;}$$

$$(R_2) \ (R, .) \text{ is a multiplicative semigroup having 0, such that } x.0 = 0.x = 0 \text{ for all } x \in R;$$

$$(R_3) \ z.(x + y) = z.x + z.y \text{ and } (x + y).z = x.z + y.z \text{ for all } x, y, z \in R.$$

If the operation "." in $(R_2)$ is commutative, then $R$ is called a commutative hyperring.

For more details about the theory of hyperrings see [5, 6].

2. Hypermodules

Throughout this paper $R$ is a commutative hyperring and all related hyper-
modules are $R$–hypermodules.

**Definition 2.1.** ([7]) A left hypermodule over a unitary hyperring $R$ is a canonical hypergroup $(M, +)$ together with an external composition $.: R \times M \to M$, denoted by $(r, m) \mapsto rm \in M$, such that for all $(x, y) \in M^2$ and all $(r, s) \in R^2$, the following hold;

$$(M_1) \ r.(x + y) = r.x + r.y;$$

$$(M_2) \ (r + s).x = r.x + s.x;$$

$$(M_3) \ (rs).x = r.(s.x);$$

$$(M_4) \ 1.m = m \text{ and } 0.m = 0, \text{ for each } m \in M.$$
A nonempty subset \( N \) of a hypermodule \( M \) is called a subhypermodule of \( M \) if \((N,+)\) is a canonical subhypergroup of \((M,+)) and \( N \) is a hypermodule over \( R \), under external composition "\( \cdot \)" from \( R \times N \) to \( N \). By \( N \subseteq M \), we mean \( N \) is a subhypermodule of \( M \).

**Lemma 2.2.** Let \( M \) be a hypermodule and \( N \) be a nonvoid subset of \( M \). Then \( N \) is a subhypermodule of \( M \) if and only if for every \( x,y \in N \) and \( r \in R \) we have \( rx + y \subseteq N \).

**Proof.** Suppose that \( N \) is a subhypermodule of \( M \). Let \( x,y \in N \) and \( r \in R \). Since \( N \) is a hypermodule over \( R \), so \( rx \in N \). Also since \((N,+)\) is a subhypergroup of \((M,+)) \( rx + y \subseteq N \).

For converse it suffices to show that \((N,+)\) is a subhypergroup of \((M,+))\). This follows from the fact that \( rx + y \subseteq N \) for every \( x,y \in N \) and every \( r \in R \). \( \square \)

We refer to [2] for more information about hypermodules and subhypermodules.

Let \( M, N \) be two \( R \)-hypermodules. A function \( f : M \rightarrow N \) is called a homomorphism if for every \( x,y \in M \) and every \( r \in R \) the following hold

1. \( f(x + y) = f(x) + f(y) \);
2. \( f(rx) = rf(x) \),

and \( f \) is called a weak homomorphism if

1. \( f(x + y) \subseteq f(x) + f(y) \);
2. \( f(rx) = rf(x) \).

A homomorphism \( f \) is called a monomorphism (monic), if \( f \) is one to one. \( f \) is called an epimorphism (epic), if \( f \) is onto and \( f \) is called isomorphism if it is epic and monic.

For two hypermodules \( M, N \) and a homomorphism \( f : M \rightarrow N \), it is easy to see that \( f(0) = 0 \).

**Proposition 2.3.** Let \( M, N, K \) be \( R \)-hypermodules, \( f : M \rightarrow N \) a homomorphism and \( g : M \rightarrow K \) an epimorphism. Moreover suppose that \( \text{Ker}(g) \subseteq \text{Ker}(f) \). Then there exists a homomorphism \( h : K \rightarrow N \) such that \( f = hog \), and the following hold

1. If \( f \) is epic, then \( h \) is epic.
2. If \( \text{Ker}(f) = \text{Ker}(g) \) then \( h \) is monic.
3. If \( f \) is epic and \( \text{Ker}(f) = \text{Ker}(g) \), then \( h \) is an isomorphism.

**Proof.** See [9, Theorem 3.1]. \( \square \)
Let $M$ be a hypermodule over a hyperring $R$ and $N \leq M$. Consider $M/N = \{m+N \mid m \in M\}$, then $M/N$ becomes a hypermodule over $R$ under hyperoperations defined by $+: M/N \times M/N \rightarrow P^*(M/N)$ and $\cdot: R \times M/N \rightarrow M/N$ such that $m+N+m'+N = \{x+N \mid x \in m+m'\}$ and $r.(m+N) = rm+N$ for $m, m' \in M$ and $r \in R$. Note that $m+N = N$ if and only if $m \in N$.

For a hypermodule $M$ and a subhypermodule $N$ of $M$ there exists a canonical epimorphism $\pi: M \rightarrow M/N$ defined by $\pi(m) = m+N$ with $\text{Ker}(\pi) = N$.

By $R-\text{hmod}$, we mean the category of all hypermodules over hyperring $R$. The following result is an immediate consequence of Proposition 2.3.

**Corollary 2.4.** Let $M, N$ be $R$–hypermodules. If $f: M \rightarrow N$ is a homomorphism and $K \leq M$. Then

1. If $K \subseteq \text{Ker}(f)$, then there exists a unique homomorphism $\bar{f}: M/K \rightarrow N$ such that $\bar{f}(m+K) = f(m)$ for every $m \in M$.
2. If $f$ is epic, then $\bar{f}$ is epic.
3. If $K = \text{Ker}(f)$, then $\bar{f}$ is monic.
4. If $f$ is epic and $K = \text{Ker}(f)$, then $\bar{f}$ is an isomorphism.

**Proposition 2.5.** Let $M, N$ be $R$–hypermodules and $f: M \rightarrow N$ be a homomorphism. Then the following are equivalent:

1. $f$ is monic;
2. $\text{Ker}(f) = 0$;
3. For every hypermodule $K$ and for homomorphisms $g, h: K \rightarrow M$, if $fog = foh$, then $g = h$.

**Proof.** See [9, Theorem 3.3].

**Proposition 2.6.** For two hypermodules $M, N$ and homomorphism $f: M \rightarrow N$, the following are equivalent:

1. $f$ is epic;
2. For every hypermodule $K$ and for homomorphisms $g, h: N \rightarrow K$, if $gof = hof$, then $g = h$.

**Proof.** See [9, Theorem 3.4].

By Proposition 2.5 and Proposition 2.6, we conclude that monomorphisms (resp. epimorphisms) in $R$–hmod are homomorphisms which are one to one (resp. onto).

**Lemma 2.7.** Let $M$ be an $R$–hypermodule. If $\{M_\alpha\}_{\alpha \in A}$ is an indexed set of subhypermodules of $M$ and $S \subseteq M$. Then
1. \( \sum_A M_\alpha = \{ t \mid t \in \sum_{F \subseteq A} m_\alpha \text{ for some finite subset } F \subseteq A \text{ and } m_\alpha \in M_\alpha \} \) is a subhypermodule of \( M \).

2. \(< S > = \{ t \mid t \in \sum_{i=1}^n r_i s_i \text{ for some } r_i \in R, s_i \in S \text{ and } n \in \mathbb{N} \} = \bigcap \{ N \mid N \leq M, N \supseteq S \} \) is a subhypermodule of \( M \).

3. \( \sum_A M_\alpha = \langle \bigcup_A M_\alpha \rangle \).

Proof. 1. Since \( 0 \in \sum_A M_\alpha \), so \( \sum_A M_\alpha \not= \emptyset \). Let \( x, y \in \sum_A M_\alpha \) and \( r \in R \). So there exist finite subset \( F, G \) of \( A \) such that \( x \in \sum_{F \subseteq A} m_\alpha \) and \( y \in \sum_{G \subseteq A} m_\beta \), for some \( m_\alpha \in M_\alpha \) and \( m_\beta \in M_\beta \). Therefore

\[
rx + y \subseteq \sum_{F \subseteq A} rm_\alpha + \sum_{G \subseteq A} m_\beta \subseteq \sum_A M_\alpha
\]

Now by Lemma 2.2, \( \sum_A M_\alpha \) is a subhypermodule of \( M \).

(2) follows from (1) and (3) follows from (1) and (2).

\[ \square \]

3. Essential Subhypermodules

Definition 3.1. Let \( M \) be a hypermodule and \( N \leq M \), then \( N \) is called an essential subhypermodule of \( M \) (denoted by \( N \leq M \)) if \( N \cap K \not= 0 \) for all nonzero subhypermodule \( K \) of \( M \); or equivalently \( N \cap K = 0 \) implies that \( K = 0 \) for every \( K \leq M \).

For two hypermodules \( M, N \), a monomorphism \( f : M \rightarrow N \) is called an essential monomorphism if \( \text{Im}(f) \leq N \).

Proposition 3.2. Let \( M \) be a hypermodule over hyperring \( R \) and \( K \leq M \). Then the following are equivalent:

1. \( K \leq M \);
2. The inclusion map \( i_K : K \rightarrow M \) is an essential monomorphism.
3. For every hypermodule \( N \) and for every homomorphism \( h : M \rightarrow N \), \( \text{Ker}(h) \cap K = 0 \) implies that \( \text{Ker}(h) = 0 \).

Proof. Straightforward. \[ \square \]

Proposition 3.3. A monomorphism \( f : L \rightarrow M \) in \( R\text{-hmod} \) is essential if and only if for all homomorphism \( h \) in \( R\text{-hmod} \), if \( hof \) is monic, then \( h \) is monic.

Proof. Suppose that \( f : L \rightarrow M \) is an essential monomorphism and \( hof \) is monic. Then \( \text{Im}(f) \cap \text{Ker}(h) = 0 \) and hence \( \text{Ker}(h) = 0 \). So \( h \) is monic.

For converse suppose that \( \text{Im}(f) \cap K = 0 \) for \( K \leq M \). Now consider the canonical epimorphism \( \pi_K : M \rightarrow M/K \), then clearly \( \pi_Kof : L \rightarrow M/K \) is monic. Hence, \( \pi_K \) is monic; i.e. \( K = 0 \) and so \( \text{Im}(f) \leq M \). \[ \square \]
Proposition 3.4. Let $M$ be a hypermodule and $K \leq N \leq M$. Then
1. $K \leq M$ if and only if $K \leq N$ and $N \leq M$.
2. $H \cap K \leq M$ if and only if $H \leq M$ and $K \leq M$.

Proof. (1) $\implies$: Suppose that $K \cap L = 0$ for subhypermodule $L$ of $N$, then $L \leq M$ and so $L = 0$. Also, $K \leq M$ implies $N \leq M$, since $K \leq N$.

$\iff$: Suppose that $K \leq N$ and $N \leq M$. Let $L$ be a subhypermodule of $M$ such that $K \cap L = 0$. Then $K \cap (L \cap N) = 0$, thus $L \cap N = 0$ and so $L = 0$.

(2) $\implies$ is clear.

For converse suppose that $(H \cap K) \cap L = 0$. Since $K \leq M$, we have $K \cap L = 0$ and similarly $L = 0$. Hence $H \cap K \leq M$, as required.

\[\Box\]

Proposition 3.5. Let $M, N$ be $R$-hypermodules, $X \leq N$ and $f : M \rightarrow N$ a monomorphism. If $X \leq N$, then $f^{-1}(X) \leq M$.

Proof. Suppose that $f^{-1}(X) \cap K = 0$ for subhypermodule $K$ of $M$. We will show that $X \cap f(K) = 0$. Let $x \in X \cap f(K)$, then $x = f(y)$ for some $y \in K$ and so $y \in f^{-1}(X) \cap K = 0$. Thus $x = f(0) = 0$, that is $X \cap f(K) = 0$. Now $X \leq N$, so we have $f(K) = 0$. Since $f$ is monic, this implies $K = 0$.

Let $M$ be a hypermodule over the hyperring $R$ and $x \in M$. Then it is not difficult to see that $Rx = \{rx \mid r \in R\}$ is a subhypermodule of $M$.

Lemma 3.6. Let $M$ be a hypermodule over hyperring $R$. Then a subhypermodule $K$ of $M$ is essential in $M$ if and only if for every $0 \neq x \in M$, there exists $r \in R$, such that $0 \neq rx \in K$.

Proof. Obvious. \[\Box\]

Proposition 3.7. Let $M, N$ be two hypermodules over hyperring $R$ and $g : M \rightarrow N$ be a monomorphism. Then for each homomorphism $f : K \rightarrow M$, $gof$ is an essential monomorphism if and only if $g$ and $f$ are essential monomorphisms.

Proof. Suppose that $g$ is a monomorphism and $gof : K \rightarrow N$ is an essential monomorphism. Let $L$ be a subhypermodule of $M$ such that $Im(f) \cap L = 0$. Then $g(Im(f) \cap L) = 0$. Now we show that $g(Im(f) \cap L) = g(Im(f)) \cap g(L)$. Clearly $g(Im(f) \cap L) \subseteq g(Im(f)) \cap g(L)$. For converse let $x \in g(Im(f)) \cap g(L)$, then $x = g(f(y)) = g(z)$ for some $y \in K$ and $z \in L$, so $0 \in g(f(y)) - g(z) = g(f(y) - z)$. Thus there exists $a \in f(y) - z$ such that $g(a) = 0$, i.e $a \in Ker(g) = \{0\}$. Hence $0 \in f(y) - z$ and so $f(y) = z$. Therefore, $0 = g(Im(f) \cap L) = g(Im(f)) \cap g(L)$ and hence $Im(gof) \cap g(L) = 0$. Since
$gof$ is an essential monomorphism, this implies $g(L) = 0$ and consequently $L = 0$ (since $g$ is monic). These implies $f$ is an essential monomorphism (since $gf$ is monic clearly $f$ is monic). Finally, since $Im(gof) \subseteq Im(g)$, $g$ must be an essential monomorphism.

For converse suppose that $h : N \rightarrow P$ is a homomorphism, such that $hogof$ is monic. It suffices show that $h$ is monic. Suppose that $Ker(h) \neq 0$. WE have $Im(g) \cap Ker(h) \neq 0$ and hence $Ker(hog) \neq 0$. Now $Im(f) \cap Ker(hog) \neq 0$, since $f$ is an essential monomorphism. Let $0 \neq x = f(k)$ such that $hog(f(k)) = 0$ for some $k \in K$. Since $hogof$ is monic, we have $k = 0$, a contradiction by $f(k) \neq 0$. Hence $Ker(h) = 0$. □

A sequence $0 \rightarrow A \xrightarrow{f} B \xrightarrow{g} C \rightarrow 0$ of hypermodules is called exact if $f$ is one to one, $g$ is onto and $Im(f) = Ker(g)$.

**Proposition 3.8.** Assume that both rows in the following commutative diagram are exact and moreover $\gamma$ is monic.

\[
\begin{array}{ccc}
0 & \rightarrow & A \\
& \downarrow{\alpha} & \downarrow{\beta} & \downarrow{\gamma} \\
0 & \rightarrow & A' & \xrightarrow{f'} & B' & \xrightarrow{g'} & C' & \rightarrow & 0
\end{array}
\]

If $f'$ is an essential monomorphism, then so is $f$.

**Proof.** Let $0 \neq K \leq B$. We consider two cases:

Case 1: $\beta(K) \neq 0$; Since $Im(f') \leq B'$, in this case we have $\beta(K) \cap Im(f') \neq 0$. So there exists $0 \neq x \in Im(f') = Ker(g')$ such that $x = \beta(k)$ for some $0 \neq k \in K$. Now $0 = g'(x) = g'(\beta(k)) = \gamma(g(k))$. Since $\gamma$ is monic, $g(k) = 0$. Hence $0 \neq k \in Ker(g) = Im(f)$.

Case 2: $\beta(K) = 0$; therefore in this case we obtain $0 = g'(\beta(K)) = \gamma(g(K))$, so $g(K) = 0$. Thus $K \subseteq Ker(g) = Im(f)$.

In both above cases we obtain $f$ is an essential monomorphism. □

**Definition 3.9.** Let $M$ be a hypermodule and $N$ a subhypermodule of $M$. Then the subhypermodule $N'$ of $M$ is called a complement of $N$ in $M$ if $N'$ is maximal with the property $N \cap N' = 0$.

By Zorn’s Lemma, every subhypermodule of an arbitrary hypermodule has a complement.

We say two subhypermodule $K, N$ of $M$ are independent, if $K \cap N = 0$. If $N, K$ are independent then $N + K$ is denoted by $N \oplus K$.

Also a subhypermodule $N$ of $M$ is called a direct summand of $M$ if $M = N \oplus N'$ for some $N' \leq M$. 
A hypermodule $M$ is called indecomposable if whenever $M = M_1 \oplus M_2$, then $M_1 = 0$ or $M_2 = 0$.

**Lemma 3.10. (Modularity Law)** Suppose that $M$ is a hypermodule and $A, B, C$ are subhypermodules of $M$ such that $B \subseteq A$. Then $A \cap (B + C) = B + (A \cap C)$.

**Proof.** Clearly $B + (A \cap C) \subseteq A \cap (B + C)$. For converse let $x \in A \cap (B + C)$. Then $x = a + b$ for some $a \in A, b \in B$ and $c \in C$. So we have $c \in a - b \subseteq A$, and hence $c \in A \cap C$. But $x \in b + c \subseteq B + A \cap C$. Thus $A \cap (B + C) \subseteq B + (A \cap C)$. □

The condition $B \subseteq A$ in Lemma 3.10 is necessary. That is in general we have not $A \cap (B + C) = (A \cap B) + (A \cap C)$. For example, consider the hypermodule $M = \{(x, y) \mid x, y \in \mathbb{Z}\}$ as $\mathbb{Z}$-hypermodule with trivial hyperoperations and let $A = \{(x, x) \mid x \in \mathbb{Z}\}$, $B = \{(x, 0) \mid x \in \mathbb{Z}\}$ and $C = \{(0, x) \mid x \in \mathbb{Z}\}$. Then $A \cap (B + C) = A$, but $(A \cap B) + (A \cap C) = \langle (0, 0) \rangle \neq A$.

**Proposition 3.11.** Let $M$ be a hypermodule and $N \leq M$. Moreover let $N'$ be a complement of $N$ in $M$. Then

(i) $N \oplus N' \leq M$.

(ii) $(N \oplus N')/N' \leq M/N'$.

**Proof.** (i) Suppose that $K \leq M$ and $(N \oplus N') \cap K = 0$. We show that $N \cap (N' \oplus K) = 0$ and then we conclude $K = 0$, by maximality of $N'$. To see $N \cap (N' \oplus K) = 0$, let $x \in N \cap (N' \oplus K)$. Then there exist $n \in N, n' \in N'$ and $k \in K$ such that $x = n \oplus n' + k$. Thus $k = n - n' \subseteq N \cap N'$ and so $k \in K \cap (N \oplus N') = 0$. Hence $x = n \in n' + 0 = \{n'\}$; i.e., $x = n = n' \in N \cap N' = 0$. Therefore $N \cap (N' \oplus K) = 0$.

(ii) Suppose that $N' \leq L$ and $(N \oplus N')/N' \cap L/N' = N'$. Then $(N \oplus N') \cap L \leq N'$ and by Lemma 3.10, $N' \oplus (N \cap L) \leq N'$. Hence $N \cap L \leq N'$ and so $L \cap N = 0$. Thus $L = N'$, by maximality of $N'$. That is $(N \oplus N')/N' \leq M/N'$.

□

**Lemma 3.12.** Suppose that $M = M_1 \oplus M_2$ is a hypermodule where $M_1, M_2$ are subhypermodules of $M$. Then for each $m \in M$ there exist a unique element $m_1 \in M_1$ and a unique element $m_2 \in M_2$ such that $m = m_1 + m_2$.

**Proof.** Obviously, for each $m \in M$ there exist $m_1 \in M_1$ and $m_2 \in M_2$, such that $m \in m_1 + m_2$. Now suppose that $m \in m_1 + m_2$ and $m \in n_1 + n_2$ for some $m_1, n_1 \in M_1$ and $m_2, n_2 \in M_2$. Thus we have $0 \in m - m \subseteq (m_1 + m_2) - (n_1 + n_2) = (m_1 - n_1) + (m_2 - n_2)$ and so there exist $x \in m_1 - n_1 \subseteq M_1$ and
Proposition 3.13. Let $M = M_1 \oplus M_2$ be a hypermodule. Then for each $i = 1, 2$, there exists a weak epimorphism $\pi_i : M \longrightarrow M_i$ such that $\text{Im}(\pi_i) = M_i$ and $\text{Ker}(\pi_i) = M_j$, $j \neq i$.

Proof. Let $m \in M$. Then there exist $m_1 \in M_1$ and $m_2 \in M_2$ such that $m \in m_1 + m_2$. Now define $\pi_1 : M \longrightarrow M_1$ by $\pi_1(m) = m_1$.

By Lemma 3.12, $\pi_1$ is well defined.

To see that $\pi_1$ is a weak homomorphism, let $m \in M$ so that $m \in m_1 + m_2$ for some $m_1 \in M_1$ and $m_2 \in M_2$. Let $r \in R$. Then $rm \in r(m_1 + n_1) = rm_1 + rn_1$ and hence $\pi_1(rm) = rm_1 = r\pi_1(m)$.

Now let $n \in M$ so that $n \in n_1 + n_2$ for some $n_1 \in M_1$ and $n_2 \in M_2$. We show that $\pi_1(m + n) \subseteq \pi_1(m) + \pi_1(n)$. Let $x \in \pi_1(m + n)$, so $x = \pi_1(y)$ for some $y \in m + n \subseteq (m_1 + m_2) + (n_1 + n_2) = (m_1 + n_1) + (m_2 + n_2)$. Thus there exist $k_1 \in m_1 + n_2 \subseteq M_1$ and $k_2 \in m_2 + n_2 \subseteq M_2$ such that $y \in k_1 + k_2$. Then we have $x = \pi_1(y) = k_1 \in m_1 + n_1 = \pi_1(m) + \pi_1(n)$; that is $\pi_1(m + n) \subseteq \pi_1(m) + \pi_1(n)$.

Obviously, $f$ is epic.

Finally, let $m \in M$ so that $m \in m_1 + m_2$ ($m_1 \in M_1, m_2 \in M_2$). By Lemma 3.12, we have $\pi_1(m) = 0$ iff $m_1 = 0$ iff $m \in 0 + m_2 = \{m_2\}$, iff $m = m_2 \in M_2$; i.e., $\text{Ker}(\pi_1) = M_2$.

Proposition 3.14. Suppose that $M$ is a hypermodule and $K_1 \leq M_1 \leq M$, $K_2 \leq M_2 \leq M$ such that $M = M_1 \oplus M_2$. Then $K_1 \oplus K_2 \leq M_1 \oplus M_2$ if and only if $K_1 \leq M_1$ and $K_2 \leq M_2$.

Proof. Suppose that $K_1 \oplus K_2 \leq M_1 \oplus M_2$ but $K_1$ is not essential in $M_1$. So there exists a nonzero subhypermodule $L_1$ of $M_1$ such that $K_1 \cap L_1 = 0$. This implies $(K_1 + K_2) \cap L_1 = 0$ that is a contradiction. To see $(K_1 + K_2) \cap L_1 = 0$, let $x \in L_1 \cap (K_1 + K_2)$. Then there exist $l_1 \in L_1, k_1 \in K_1$ and $k_2 \in K_2$ such that $x = l_1 \in k_1 + k_2$. Thus $k_2 \in l_1 - k_1 \subseteq M_1$; i.e, $k_2 \in M_1 \cap M_2$ is $0 = 0 \in L_1 \cap K_1 = 0$. Similarly $K_2 \leq M_2$.

Conversely suppose that $K_1 \leq M_1$ and $K_2 \leq M_2$. Let $0 \neq x \in M_1 \oplus M_2$, then $x \in m_1 + m_2$ for some $m_1 \in M_1$ and $m_2 \in M_2$. Since $x \neq 0$, at least one of $m_1$ and $m_1$ must be nonzero. We consider two cases:

Case 1. $m_2 = 0$ or $m_1 = 0$: Suppose that $m_2 = 0$, then $m_1 \neq 0$ and by Lemma 3.6, there exists $r_1 \in R$ such that $0 \neq r_1m_1 \in K_1$. Therefore
Suppose that 0 ≠ r1 ∈ K1 ⊆ K1 ⊕ K2. Hence K1 ⊕ K2 ≤ M1 ⊕ M2 by Lemma 3.6. Similarly we have for m2 = 0.

Case 2. Both m1 and m2 are nonzero: By using Lemma 3.6, there exists 0 ≠ r1 ∈ R such that 0 ≠ r1m1 ∈ K1. If r1m2 ∈ K2, then r1x ∈ r1(m1 + m2) = r1m1 + r2m2 ⊆ K1 ⊕ K2 and by independency r1x ≠ 0. If r1m2 ∉ K2, again by Lemma 3.6, there exists r2 ∈ R such that 0 ≠ r2r1m2 ∈ K2 and hence 0 ≠ r2r1x ∈ r2r1m1 + r2r1m2 ⊆ K1 ⊕ K2. Thus K1 ⊕ K2 ≤ M1 ⊕ M2. □

Proposition 3.15. Let M be a hypermodule and K an essential subhypermodule of M such that K = (K ∩ M1) ⊕ (K ∩ M2), whenever M = M1 ⊕ M2. If K is indecomposable, then so is M.

Proof. Suppose that M = M1 ⊕ M2 is a decomposition of M. By hypothesis K = (K ∩ M1) ⊕ (K ∩ M2). Since K is indecomposable, so we have K ∩ M1 = 0 or K ∩ M2 = 0 and hence M1 = 0 or M2 = 0, as K ≤ M. That is M is indecomposable.

Let M be any hypermodule and {Mα}α∈A an indexed set of subhypermodules of M. Then {Mα}α∈A is called independent if Mα ∩ (∑β∈A\{α\} Mβ) = 0 for every α ∈ A. If {Mα}α∈A is independent then the sum ∑α∈A Mα is denoted by ⊕α∈AMα.

Lemma 3.16. Let M be any hypermodule and {Mα}α∈A an indexed set of subhypermodules of M. Then the following statements are equivalent
1) {Mα}α∈A is independent;
2) {Mα}α∈F is independent for every finite subset F of A;
3) (∪β∈B Mβ) ∩ (∪γ∈C Mγ) = 0, for every pair B, C ⊆ A with B ∩ C = 0.

Proof. Straightforward. □

Proposition 3.17. Suppose that M is a hypermodule and {Lα}α∈A is a set of independent subhypermodules of M. Let {Mα}α∈A be a set of subhypermodules of M such that Lα ≤ Mα; for each α ∈ A. Then the following hold
1) {Mα}α∈A is independent.
2) ⊕α∈ALα ≤ ⊕α∈AMα.

Proof. First we show that (1), (2) hold for every finite subset F of A. Let L1, L2 be independent and L1 ≤ M1, L2 ≤ M2. So we have (L1 ∩ M2) ∩ L2 = L1 ∩ L2 = 0, and hence L1 ∩ M2 = 0 as L1 ≤ M1. Moreover, (M1 ∩ M2) ∩ L1 ≤ L1 ∩ M2 = 0 that implies M1 ∩ M2 = 0 as L1 ≤ M1. Thus M1, M2 are independent. By Proposition 3.14, L1 ⊕ L2 ≤ M1 ⊕ M2. By using induction, we see that (1),
(2) hold for every finite subset $F \subseteq A$. Now by Lemma 3.16, \( \{M_\alpha\}_{\alpha \in A} \) is independent. To obtaining (2), let $0 \neq x \in \bigoplus_A M_\alpha$. Then $x \in m_{\alpha_1} + m_{\alpha_2} + ... + m_{\alpha_n}$ for some $m_{\alpha_i} \in M_{\alpha_i}$ and $n \in \mathbb{N}$, where $\{\alpha_1, \alpha_2, ..., \alpha_n\} \subseteq A$. That is $x \in \bigoplus_{i=1}^n M_{\alpha_i}$. Since $\bigoplus_{i=1}^n L_{\alpha_i} \subseteq \bigoplus_{i=1}^n M_{\alpha_i}$, by Lemma 3.6 there is an $r \in R$ such that $0 \neq rx \in \bigoplus_{i=1}^n L_{\alpha_i} \leq \bigoplus_{\alpha \in A} L_{\alpha}$. Hence $\bigoplus_{\alpha \in A} L_{\alpha} \leq \bigoplus_{\alpha \in A} M_{\alpha}$, that completes the proof. \( \square \)

4. Examples

Example 4.1. Consider $\mathbb{Z}$–hypermodule $\mathbb{Z}$ with trivial hyperoperations. Then every subhypermodule of $\mathbb{Z}$ is essential in $\mathbb{Z}$ and the corresponding inclusion map is an essential monomorphism.

Example 4.2. Let $M$ denote the $\mathbb{Z}$–hypermodule $\mathbb{Z}/6\mathbb{Z}$ with trivial hyperoperations. Then $\mathbb{Z}/6\mathbb{Z} = 2\mathbb{Z}/6\mathbb{Z} \oplus 3\mathbb{Z}/6\mathbb{Z}$ and hence neither $2\mathbb{Z}/6\mathbb{Z}$ nor $3\mathbb{Z}/6\mathbb{Z}$ is essential in $\mathbb{Z}/6\mathbb{Z}$.
