ABSTRACT

An update checklist of the ground beetles in the middle of Iraq is presented. This investigation was conducted from October 2020 till September 2021 and revealed 42 species belonging to 32 genera, 17 tribes and 13 subfamilies of Carabidae. In the present checklist, synonyms, locations and global distributions were provided.

Keywords: Carabidae, Checklist, Coleoptera, Ground beetles, Iraq.

Article type: Research Article.

INTRODUCTION

The family Carabidae is a name derived from the Greek name karabos, meaning “horned beetle”, where the Latin name Carabus was used by Carolus Linnaeus, in his famous book, *Systema Naturae* 1758, where they are called ground beetles or carabes or carabids as common names. Ground beetles are predatory insects. This family includes 24 subfamilies, 110 tribes, and more than 40,000 species dating back to 1927 genera described worldwide (Erwin 1985; Larochelle & Lariviere 2007). Whereas GBIF (2021) in update information reached 41,552 species around the world. Cicindelinae is one of very important group which contain 108 genera (Moravec 2010). The species of this family inhabit mainly Tropical regions (Afrotropical, Neotropical, Oriental and tropical part of Australia), and distributions of some species extend into the Holarctic region, with highest variety in the southern part of Palearctic region (Hackel & Farkac 2013). Carabidae live on the ground, and mainly prey on the ground and soil invertebrates as well as on soil insects including larvae, wireworms, ants, aphids and snails. Also, the members of ground beetles can be found under rocks and stones, in logs and grass (Shibuya *et al.* 2014). Carabid fauna of Iraq is still not well studied, especially that of middle of Iraq regions. Derwesh (1965) listed 60 species in Iraq, then Kaddou (1967) added 13 species, also Swailem *et al.* (1974) added 3 species to this guild. Furthermore, Abdul Rassoul (1976) recorded 12 species, and Al-Ali (1999) reported one species in his investigation, in addition to taxa listed in the newest catalogue by Lobl & Smetana (2003) and Bousquet (2012). Recently, Ramzi (2014) studied 18 species with one species registered as a new record for fauna of Iraq. On the other hand, Al-Ibadi (2021) studied 41 species, three of them were recorded for the first time. The goals of the current checklist is to provide updates credible information for future taxonomic and faunistic studies.

MATERIALS AND METHODS

In this study, the specimens were collected in various localities in the middle of Iraq: Saladin, Wasit, Diyala, Karbala, Najaf, Babylon, Baghdad and Al-Anbar Provinces, for the period from October 2020 to September 2021. The specimens were collected using different methods, such as hand picking, light trap and plastic pitfall trap which is one of the most common methods for collecting these beetles (Skvarla *et al.* 2014). Taxonomic position and scientific names of species were identified by authors using original descriptions, available keys, such as those

by Ross (1948), Ali (1966), Lindroth (1974), Liebherr (1991), Arnett & Thomas (2001), Matalin & Chikatunov (2016), and catalogues such as those by Lobl & Smetana (2003) and Bousquet (2012).
